DNA MOLECULES ENCODING BACTERIAL LYSINE 2,3-AMINOMUTASE

ABSTRACT OF THE DISCLOSURE

Purified β-amino acids are of considerable interest in the preparation of

pharmacologically active compounds. Although enantiomerically pure β-amino acids,
such as L-β-lysine, can be produced by standard chemical synthesis, this traditional
approach is time consuming, requires expensive starting materials, and results in a
racemic mixture which must be purified further. However, DNA molecules encoding
lysine 2,3-aminomutase can be used to prepare L-β-lysine by methods that avoid the

pitfalls of chemical synthesis. In particular, L-β-lysine can be synthesized by cultures of
host cells that express recombinant lysine 2,3-aminomutase. Alternatively, such
recombinant host cells can provide a source for isolating quantities of lysine 2,3aminomutase, which in turn, can be used to produce L-β-lysine in vitro.
